A Situated Cognition Approach to Social Modeling of Teams in Complex Systems

John S Gero
Krasnow Institute for Advanced Study
George Mason University

NASA Goddard May 9 2012

Common Assumptions in Modeling Complex Engineered Systems

Perfect or bounded rationality

Lossless or near lossless information transfer

Little or no learning

Little or no cognitive behavior

Little or no social behavior

Primarily third person knowledge

SITUATED COGNITION

Third-Person Knowledge

- Knowledge from physical sciences
- Knowledge from engineering science
- Knowledge from computer science
- Knowledge from organizational science

First-Person Knowledge

- Knowledge from doing
- Knowledge from interacting in the world

Where you are when, matters

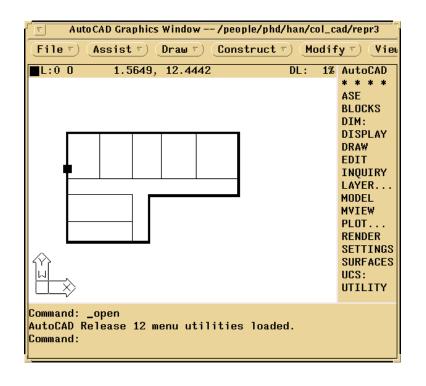

Krasnow Institute for Advanced Study

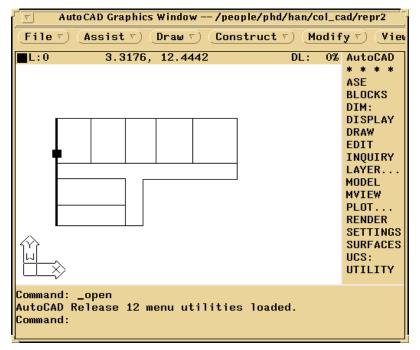

What you are looking for affects what you see

I cdnuolt blveiee taht I cluod aulaclty uesdnatnrd waht I was rdanieg. Aoccdrnig to rscheearch at Cmabrigde Uinervtisy, it deosn't mttaer in waht oredr the ltteers in a wrod are, the olny iprmoatnt tihng for esay rdeinag is taht the frist and Isat Itteer be in the rghit pclae. The rset can be a taotl mses and you can sitll raed it wouthit a porbelm. Amz3nig huh? Yaeh, and I awlyas thought slpeling was ipmorantt.

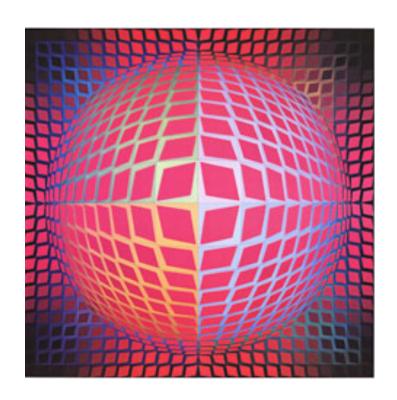

No unique representation of world: depends partly on your expectations

What you see is not necessarily what you get

What you see is not necessarily what is there

Vasarely

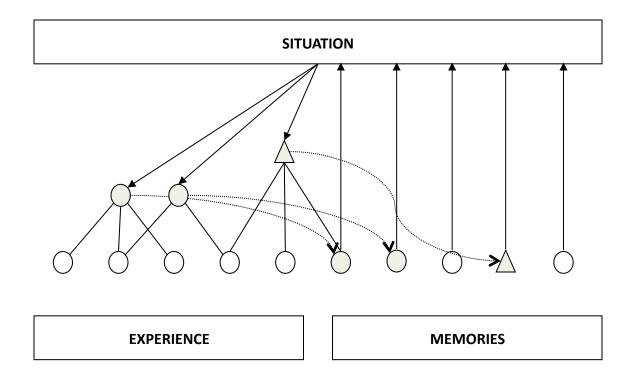

Memory and remembering

"Remembering is not the re-excitation of innumerable fixed, lifeless and fragmentary traces. It is a ... reconstruction, or construction, built out of the relation of our *attitude* towards a whole active mass of organised past reactions or experience, and to a little outstanding detail which commonly appears in image or in language form." Bartlett (1932)

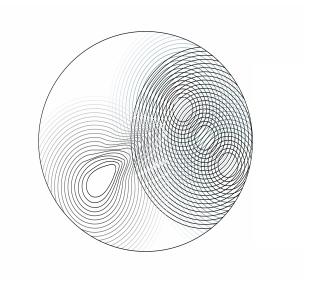

Constructive memory

- memory is reasoning process
- index need not be explicit
- index changed by its use
- content changed by its use
- memory structure changed by its use
- memories constructed through need to have memory
- memories function of past interactions and interactions at time and place of need to have memory

Constructive Memory

Constructive memory

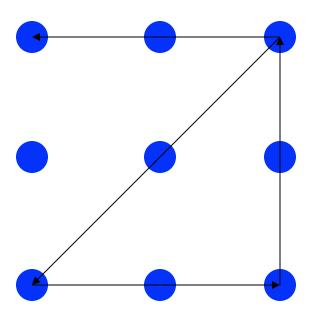

Experiences

"subsequent experiences structure and hence give meaning to what was experienced before." Dewey (1896) via Clancey (1997)

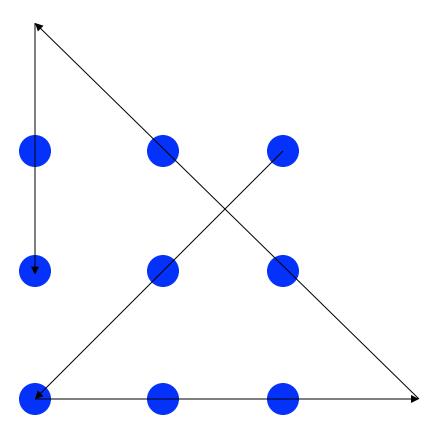

Situatedness:

Situations ≅ World View ≅ Meanings, Values, Expectations

Situation 1

Situation 2

Situations give meanings

Example of unsafe demolition practices

Krasnow Institute for Advanced Study

Situated Cognition

Basic Ideas

Knowledge from interaction not just encoding Memory by construction not just recall Situations give meanings and expectations

Cognitive Situatedness Principles

Principles for Engineered Teams

Principle of Effect
What you do matters

Principle of Ordered Temporality
When you do what you do matters

Lemma of Experience

What you did before affects what you do now

Principle of Locality

Where you are when you do what you do matters

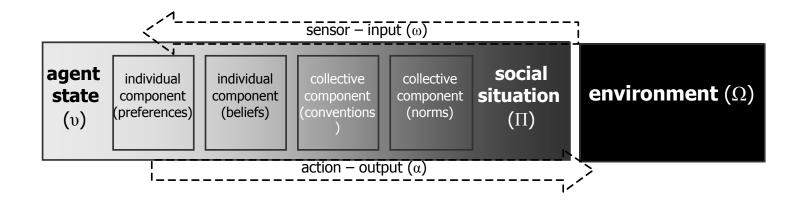

Principle of Interaction

Who and what you interact with matters

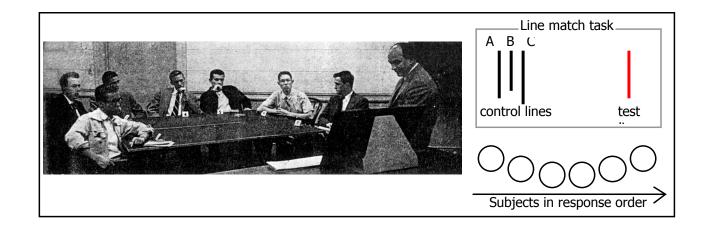

Principle of Ontology

What you think the world is about affects what it is about for you

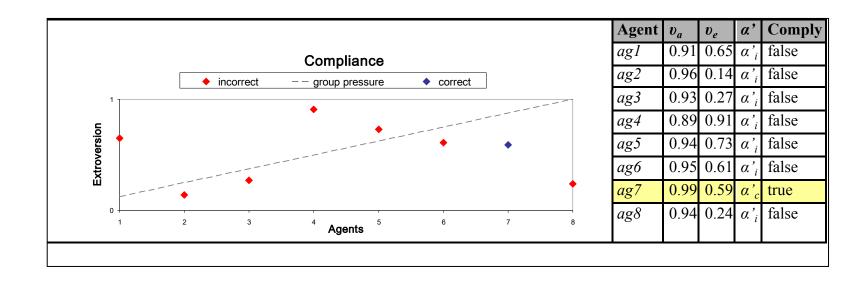

Situated Social Agents

Asch's 1951 Social Pressure Experiment

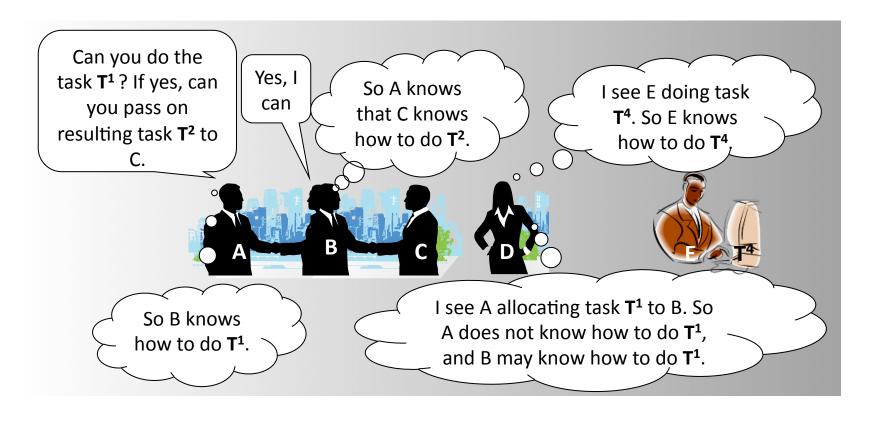

Social Agent Model Results for Asch Experiment

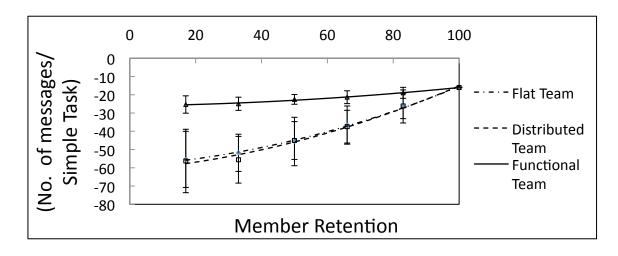

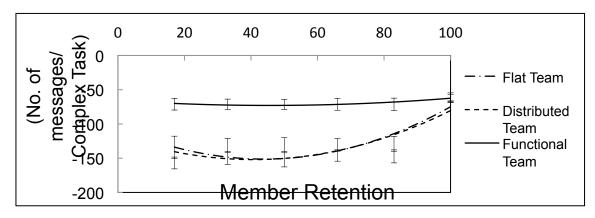

Computational Modeling: Social Cognitive Agents

Social Learning in Teams

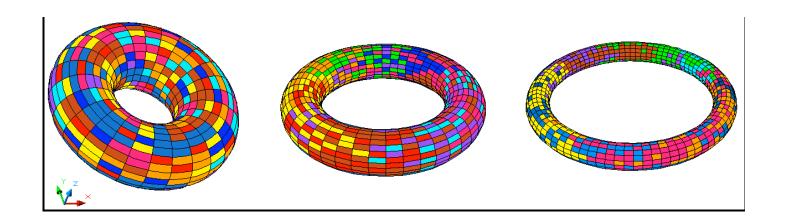

Effect of Team Member Retention on Communication

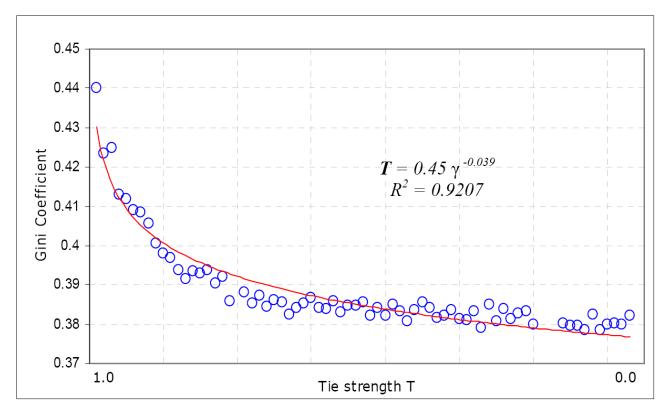

Social Structure Modeling Using Cellular Automata

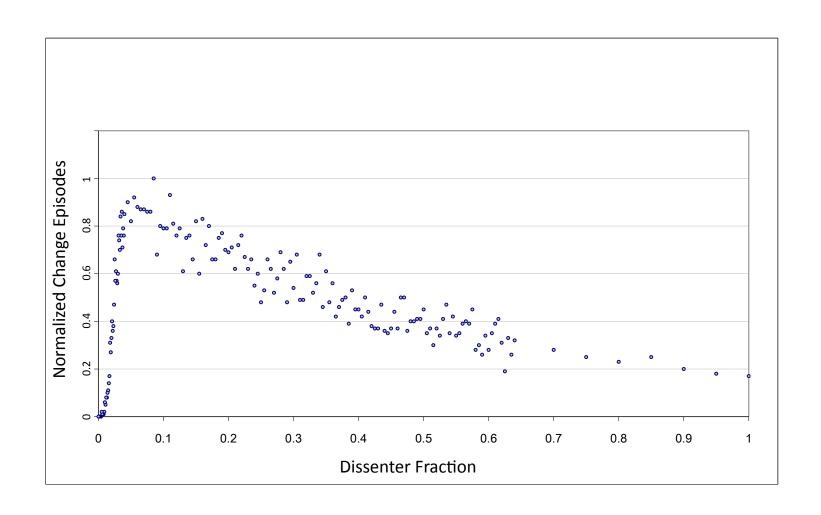

Influence of Social Ties in Teams

As **T** increases, exchange of opinions decreases and influence concentrates (Gini coefficient increases), increase hierarchies

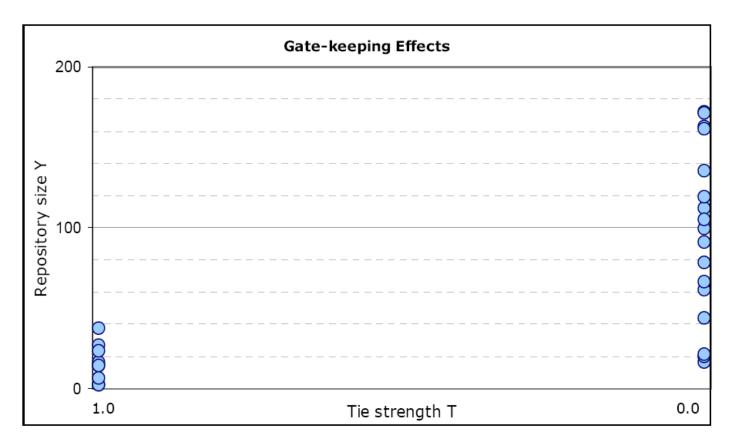

As **T** decreases, exchange of opinions increases and influence structures of dominance are more distributed (Gini coefficient decreases), flatter hierarchies

Dissenters in Teams

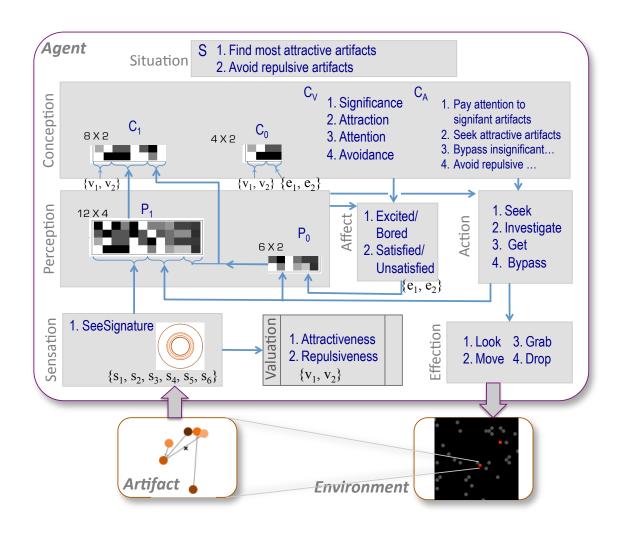

Gatekeeping Effects

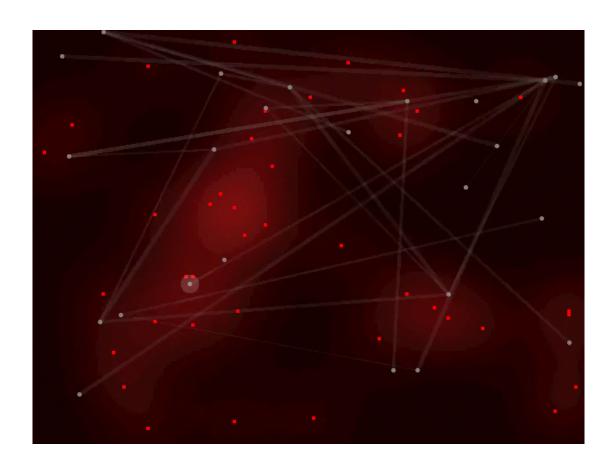

Boundary values T = 0 and T = 1 only

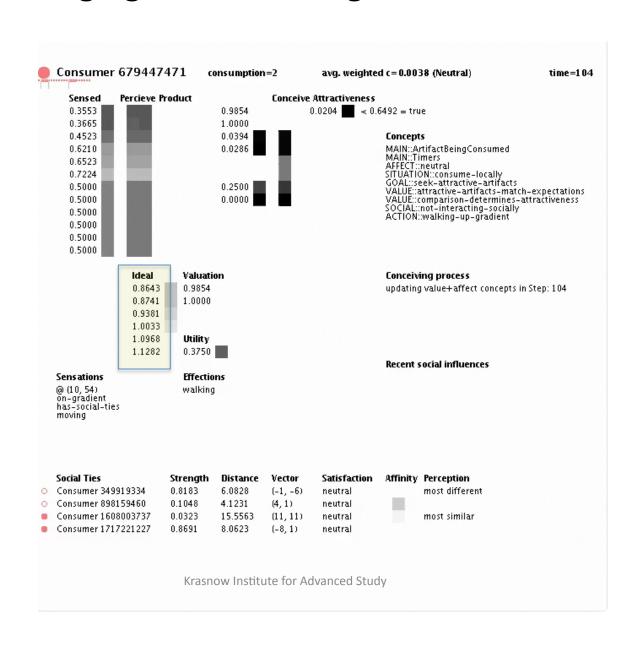

Cognitively Rich Agents

Changing Value of Ideas

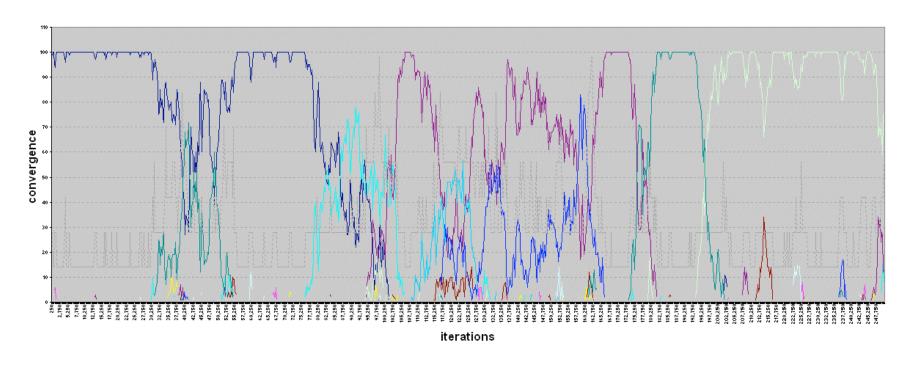

Changing Values Through Interaction

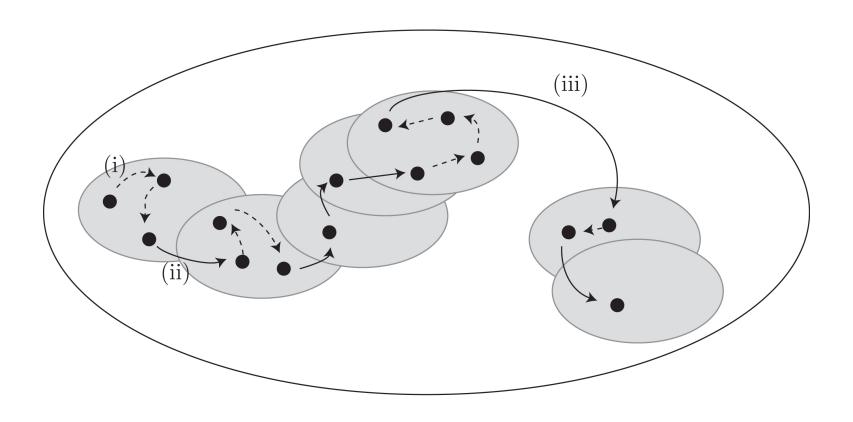

Valuation of Ideas
